Background
Not removing and disposing of babies’ and young children’s poo safely from the house and the environment causes big health risks for Solomon Islanders, especially babies and children.

A team of researchers from Solomon Islands National University (SINU) visited three villages in Isabel Province between February and March 2020 to learn about how people handle and dispose of baby and child poo, why they do this and what are the different roles of men and women.

Research process
The research team spent a week in each village. All three of these villages had taken part in a program to promote toilets and end open defecation. This program was called Community-Led Total Sanitation, or CLTS. In one village all houses had toilets, in another one almost all houses had toilets, and in the third one only a few did. The most common types of toilets were dry pits, but there were also some flush toilets.

The research team spoke with mothers, fathers and grandmothers of young children, as well as village Chiefs and members of village committees, like women’s groups and sanitation or health committees. The research team also looked at toilets and taps, and asked people to demonstrate how they get rid of their child’s poo.

Key findings
Handling the poo
There are different ways of handling and cleaning the poo away.

Convenience, or what is easiest, was important when choosing what to do with the baby or child poo. Houses close to a river or the beach used those places to get rid of poo. Putting the poo in the toilet was also common, but it required more effort (for example, having to carry water for flushing). Toilets were also sometimes difficult to access because of steep or slippery paths. People also got rid of poo by throwing it in the bush or burying it.

Children started using the toilet around the age of 3. However, children could be scared of poor-quality toilets.

No one reported leaving poo on the ground, throwing it in the garbage, or being too disgusted by it to clean it. Poo becomes more disgusting when the children start eating solid foods.

Throwing the poo in or around the garden, river or sea was believed to contaminate food and fish. Poo on the ground was also thought to attract flies which could spread dirt to food.

Participants reported different reasons for cleaning the poo away. An important reason was
to do what was best for their child. Other reasons were because that is what everyone else in the village does, and because it would be embarrassing if a visitor came to their house and found poo lying around.

Participants had a high level of knowledge about poo, flies, food, and disease, and would get rid of poo in ways that avoided flies and smells (for example, throwing in the sea or river or burying).

**The roles of men and women**

The mother was the main carer for children and the main person who would handle the baby’s or child’s poo. Handling the child’s poo was seen mainly as a woman’s job.

Fathers did clean their baby’s or child’s poo if the mother was not available. Some people thought men should not do this because other people might think he was doing a “woman’s job”. In the past it was also thought that handling children’s poo could bring bad luck in hunting and fishing. However, people said that these beliefs are changing, and some men could be praised for looking after children, including cleaning their poo.

**Key lessons**

1. To maintain children’s good health and avoid diseases, it is important to always clean baby and child poo properly. This includes always washing dirty clothes, cleaning any tools that came in contact with poo (for example, shovels), and wash hands with soap.

2. Although sometimes it isn’t the easiest or most convenient, the safest way to dispose of poo is in a good toilet that keeps poo away from people and out of the environment. When you put poo in the toilet, no one will come in contact with it, which is why this is the safest way of reducing risks to health.

3. Both mothers and fathers clean their baby’s or child’s poo, and it is becoming more acceptable for men to do so. Both men and women believe that men should be more involved in cleaning the baby’s or child’s poo, as this ultimately will benefit the baby/child more than anyone.

We thank the community members for the very valuable assistance in learning about child faeces management in their villages.
